## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 174 and 175 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Claims 174-175 are allowable over the prior art for at least the reason that the prior art fails to teach and/or suggest a method or system for producing a modulated beam of light with the claimed combination of features including means for integrating a white light beam to have substantially uniform flux, means for collimating the beam, means for filtering and removing portions of the beam, means for resolving the beam into two polarized components then rotating, recombining and shaping the beam into a single polarization, collimated, uniform, rectangular white light beam, means for separating the white light beam into single polarization color beams, means for adjusting and removing a portion of color, means for altering the polarization of each color beam then recombining the altered colored beams into a single polarization, collimated, uniform, rectangular color beam, means for resolving the colored beam into two polarized components and means for passing one of the beams to a projections means.

Kurematsu et al., U.S. Patent No. 5,267,029 disclose a system and method for producing a modulated beam of light including some of the claimed features like means for collimating the beam (13), means for resolving the beam into two polarized components then rotating and recombining the beam into a single polarization (12), means for separating the white light beam into single polarization color beams (7, 11), and means for adjusting and removing a portion of color (3, 4, 5, 6, 8) but fails to teach and/or suggest the entire claimed combination of features.
